## Control Systems

### Chapter 1

#### Introduction ..... 1

- 1.1 Elements of Control System (Components) ..... 1
- 1.2 Open-Loop Control System ..... 2
- 1.3 Closed-Loop Control System ..... 3
- 1.4 Comparison between Open-Loop and Closed-Loop Control Systems ..... 4
- 1.5 Laplace Transformation ..... 4
- 1.6 Properties and Theorems of Laplace Transforms ..... 6

### Chapter 2

#### Transfer Function ..... 12

- 2.1 Transfer Function and Impulse Response Function ..... 12
- 2.2 Poles and Zeros of a Transfer Function ..... 12
- 2.3 Properties of Transfer Function ..... 14
- 2.4 Applicability of Transfer Functions ..... 15
- 2.5 Transfer Functions of Control Loop Configurations ..... 16
- 2.6 Interacting & Non-Interacting Systems ..... 16
- 2.7 Standard Test Signals ..... 18
- 2.8 Impulse Response of Linear Systems ..... 18
- 2.9 Analogous Systems ..... 19
- 2.10 Transfer Function of Mechanical Systems ..... 19
- 2.11 Gear Train ..... 20

### Chapter 3

#### Block Diagrams : Representation and Reduction Techniques ..... 31

- 3.1 Introduction ..... 31
- 3.2 Block Diagram Fundamentals ..... 31
- 3.3 Forms of Interconnected subsystem in Block Diagram .. 32
- 3.4 Block Diagram Transformation Theorems ..... 35
- 3.5 Feedforward Compensation ..... 40

### Chapter 4

#### Signal Flow Graphs ..... 59

- 4.1 Introduction ..... 59
- 4.2 Terminology of SFG ..... 59
- 4.3 Basic Properties of SFG ..... 61
- 4.4 Signal Flow Graphs Algebra ..... 61
- 4.5 Construction of Signal Flow Graphs for Linear Equations . 62
- 4.6 Mason's Gain Formula ..... 65

### Chapter 5

#### Feedback Characteristics ..... 78

- 5.1 Need for Feedback in Control Systems ..... 78
- 5.2 Effect of Feedback on Sensitivity ..... 79
- 5.3 Effect of Feedback on Overall Gain ..... 83
- 5.4 Effect of Feedback on System Dynamics ..... 86
- 5.5 Effect of Feedback on System Stability ..... 87
- 5.6 Effect of Feedback on Bandwidth ..... 88
- 5.7 Effect of Feedback on Disturbance Signal Consequence . 89
- 5.8 Effect of Noise (Feedback path) Signals ..... 90
- 5.9 Linearizing Effect of Feedback ..... 91

### Chapter 6

#### Modelling of Control Systems ..... 99

- 6.1 Introduction ..... 99
- 6.2 Mechanical Systems ..... 99
- 6.3 Electrical Systems ..... 104
- 6.4 Modelling of Electrical Systems ..... 105
- 6.5 Servomechanism ..... 105
- 6.6 Armature Controlled DC Servomotor ..... 105
- 6.7 Torque Speed Characteristics ..... 107
- 6.8 Field Controlled DC Servomotor ..... 108
- 6.9 Comparison between Field and Armature Voltage Controlled dc Servomotors ..... 110

6.10 Two Phase AC Servomotor .....	111
6.11 Potentiometer .....	113
6.12 Tachometers.....	114
6.13 Synchro.....	115
6.14 Position Control System.....	118
6.15 Modelling of Systems with Transportation Lag .....	120
6.16 Modelling of Pneumatic, Thermal and Hydraulic Systems.....	121

## Chapter 7

### Time Domain Analysis of Control Systems ..... 127

7.1 Introduction.....	127
7.2 Time Response of a Control System.....	127
7.3 Steady State Error.....	128
7.4 Transients State Analysis .....	128
7.5 Time Response of a Second Order Control System ...	134
7.6 Transient Response Specifications and Evaluation...	142
7.7 Effect of Adding a zero to a System.....	153
7.8 Dominant Poles of Transfer Functions.....	153
7.9 Time Response of Higher Order Control System .....	155
7.10 Static Error Coefficients.....	158
7.11 Steady-state Error for Disturbances.....	165
7.12 Non-unity Feedback Control System with Disturbance.	166
7.13 Dynamic (or generalised) Error Coefficients.....	167
7.14 Relationship between Static and Dynamic Error Constants: Special Case .....	169
7.15 Performance Indices .....	170
7.16 Optimal Control Systems.....	172

## Chapter 8

### Stability Analysis of Linear Control Systems ..... 181

8.1 The Concept of Stability .....	181
8.2 Absolute and Relative Stability .....	181
8.3 The Routh-Hurwitz Stability Criterion (Absolute Stability) .....	184
8.4 Relative Stability Analysis Using Routh Array .....	191

## Chapter 9

### The Root Locus Technique ..... 195

9.1 Introduction.....	195
9.2 Angle and Magnitude Conditions.....	196
9.3 Construction Rules of Root Locus .....	196
9.4 Equation for the Root Locus.....	200
9.5 Gain Margin and Phase Margin from Root Locus Plot .	209
9.6 Time Domain Response from Root Locus .....	210
9.7 Effects of Adding Poles and Zeros to $G(s)$ $H(s)$ .....	212
9.8 Closed-Loop Transfer Function from Root Locus .....	213
9.9 Complementary Root Locus (CRL) or Inverse Root Locus (IRL) .....	214
9.10 Construction Rules for Complementary Root Locus (CRL).....	215
9.11 Root Contour .....	216
9.12 Pole Sensitivity .....	219
9.13 Root Loci of Systems with Pure Time Delay .....	221

## Chapter 10

### Frequency Domain Analysis of Control Systems ..... 233

10.1 Introduction.....	233
10.2 Advantage of Frequency Response.....	234
10.3 Frequency Response Analysis of Second Order Control System.....	234
10.4 Frequency-Domain Specifications.....	236
10.5 Correlation between Time and Frequency Response...	239
10.6 Relation between Frequency Response Specifications and Time-domain Specifications.....	241
10.7 Frequency Domain Analysis of Delay Time or Transportation Lag Elements.....	242
10.8 Frequency Domain Analysis of Minimum & Non minimum Phase Functions .....	242
10.9 Relative Stability: Gain Margin and Phase Margin ...	243
10.10 Gain Margin and Phase Margin for Second Order Control System.....	245
10.11 Graphical Methods of Frequency Domain Analysis.	249
10.12 Polar Plots.....	249

10.13 Properties of Polar Plots.....	251
10.14 Stability from Polar Plots.....	257
10.15 Gain Phase Plot .....	258
10.16 Theory of Nyquist Criterion.....	259
10.17 Properties of Mapping.....	262
10.18 Gain Margin and Phase Margin.....	266
10.19 Conditionally Stable Systems.....	268
10.20 Bode Plots .....	270
10.21 Basic Factors of $G(j\omega)$ $H(j\omega)$ .....	271
10.22 General Procedure for Constructing the Bode Plots	276
10.23 Stability from Bode Plot .....	279
10.24 Determination of Static Error Coefficients from Initial Slope of Bode Plot .....	280
10.25 Closed-Loop Frequency Response.....	281
10.26 Properties of M Circles .....	282
10.27 Properties of Constant N Circles .....	283
10.28 Non-unity Feedback Systems .....	284
10.29 Nichols Charts.....	284
10.30 Illustration .....	284
10.31 Procedure to Determine Closed-loop Frequency Response using Nichols Chart.....	285

## Chapter 11

### Compensators & Industrial Controllers ..300

11.1 Introduction to Compensators.....	300
11.2 Lead Compensator .....	302
11.3 Phase Lead Network (Passive Realization) .....	305
11.4 Lag Compensator.....	305
11.5 Phase Lag Network (Passive Realization).....	308
11.6 Lag-Lead Compensator.....	308
11.7 Phase Lag-Lead Network (Passive Realization) .....	310
11.8 Design by Gain Adjustment .....	311
11.9 Other Compensator Design Methods (Design by Cascade Compensation) .....	315
11.10 Lead Compensator Design.....	315
11.11 Lag Compensator Design.....	320
11.12 Lag-Lead Compensator Design.....	324

11.13 Physical Realization of Compensators.....	330
11.14 Comparison of Lead and Lag Compensators.....	331
11.15 Design by Feedback Compensation.....	331
11.16 Industrial Controllers.....	333
11.17 Proportional (P) Controller.....	333
11.18 Integral (I) Controller (Reset Mode).....	334
11.19 Derivative (D) Controller (Rate Mode).....	335
11.20 Proportional Integral (P-I) Controller.....	337
11.21 Proportional Derivative (P-D) Controller .....	339
11.22 Proportional Integral Derivative (P-I-D) Controller...	340
11.23 Op-Amp Based Realisation of Controllers .....	342
11.24 Tuning of PID Controllers.....	344

## Chapter 12

### State Variable Analysis of Control Systems .....351

12.1 Introduction.....	351
12.2 State Space Representation of Control System.....	351
12.3 Special Case: State Equation for Case that Involves Derivative of Input.....	353
12.4 State-Space Representation using Physical Variables - Physical Variable Model .....	353
12.5 Procedure for Deriving State Model for a given Physical System.....	359
12.6 State Model from Transfer Function.....	359
12.7 State Model from Signal Flow Graph .....	372
12.8 Transfer Function from State Model.....	373
12.6 Stability from State Model .....	375
12.9 Solution of State Equations in s-domain .....	378
12.10 Solution of State Equation on Time Domain .....	379
12.11 Properties of State Transition Matrix $[f(t) = e^{At}]$ .....	381
12.12 Cayley-Hamilton Theorem .....	385
12.13 Controllability and Observability .....	385
12.14 Design in State-space by Pole Placement .....	387

# Introduction

**Control System:**

- Control system is a means by which any quantity of interest in a machine, mechanism or other equipment is maintained or altered in accordance with a desired manner.
- Control system can also be defined as the combination of elements arranged in a planned manner wherein each element causes an effect to produce a desired output.

## 1.1 Elements of Control System (Components)

The following block-diagram representation shows typical elements of a control system.

1. **Command input:** An input signal which, has a different form than that of feedback signal.
2. **Input transducer:** A transducer that converts the command signal into the same form as that of feedback signal.
3. **Reference input:** An external signal applied to the control system in order to command a specified action of plant.
4. **Error:** The algebraic sum of reference signal input and feedback signal which is fed to controller.
5. **Actuator:** A device that produces appropriate actuating signal that causes the necessary change in the controlled variable.
6. **Controller:** Produces control signal that is applied to actuator.
7. **Control signal:** Signal from the output of the controller that is applied to the plant to affect necessary changes in controlled variable.
8. **Process:** The central component whose output variable is to be controlled. The actuator and process are together known as plant.
9. **Feedback unit:** An output transducer that converts the controlled output into proper form of feedback signal.
10. **Feedback signal:** Generated by feedback unit and is a function of controlled output.

Control systems are classified into two general categories as open-loop and closed-loop systems.

**NOTE:** Open loop control systems does not require performance analysis.

## 1.2 Open-Loop Control System

A control system in which the output has no effect on the control action is called open loop control system. The output is neither measured nor fed back for comparison with the input and to produce an error signal.

**Ex.:** Washing machine, Coffee dispenser machine, Bread toaster.

For desired output, the system is calibrated (input is set at a predetermined value). For example, preset timings of traffic lights.

### Advantages of Open-loop System

1. Simple in construction and easy to maintain
2. Less expensive due to minimum control devices
3. No instability problem
4. Accurate performance once calibrated
5. Convenient when output is difficult to measure or not economically feasible.

### Disadvantages of Open-loop System

1. Disturbances cause drift in desired output
2. Changes in calibration causes error in system
3. Recuperation at regular intervals may be necessary to maintain quality of output.

#### Example - 1.1

Explain control action of a ceiling fan regulator and draw the component block diagram.

#### Solution:

A fan regulator consists of a series switch and speed regulator which alters the voltage of fan motor for attaining different speeds. The output speed is not measured so the control scheme is open loop.

#### Example - 1.2

Indicate the type of control of an automatic washing machine and represent using a block diagram.

#### Solution:

An automatic washing machine has preset timings for various operations like soaking, washing, rinsing and drying. The timer and relay acts as controller. The clothes to be washed form the process. There is no measurement of quality of wash so it is an open-loop system.

## 1.3 Closed-Loop Control System

A control system that measures output and adjusts the input accordingly by using a feedback signal is called closed-loop control system. So, it also known as feedback control system.

### Advantages of Closed Loop Control Systems

- (a) Accurate and reliable
- (b) Reduced effect of parameter variation
- (c) Bandwidth of the system can be increased with negative feedback
- (d) Reduced effect of non-linearities

### Disadvantages of Closed Loop Control Systems

- (a) The system is complex and costly
- (b) System may become unstable
- (c) Gain of the system reduces with negative feedback

Some common examples of closed loop control systems are:

- (a) Electric iron
- (b) DC motor speed control
- (c) A missile launching system (direction of missile changes with the location of moving target)
- (d) Radar tracking system
- (e) Human respiratory system
- (f) Autopilot system
- (g) Economic inflation

#### Example - 1.3

In a simple voltage control scheme for a dc generator running at constant speed, a human operator observes the voltmeter reading. If there is any error, the field current is adjusted to keep the terminal voltage at a specified value. Represent the above system by a block-diagram.

#### Solution:

For the given manual feedback control system:

Reference input : Voltmeter leading

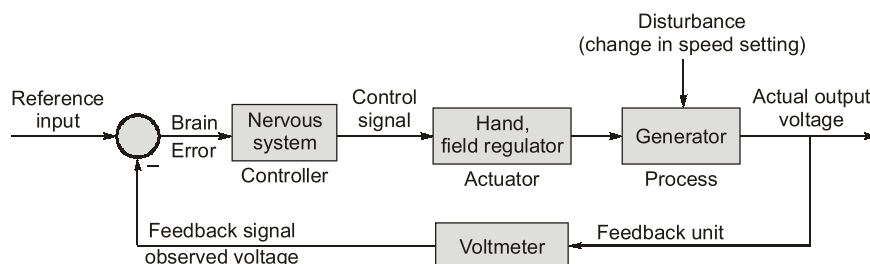

Error detector : Brain

Controller : Nervous system

Actuator : Hand, field regulator

Process : D.C. generator

Output transducer : Voltmeter

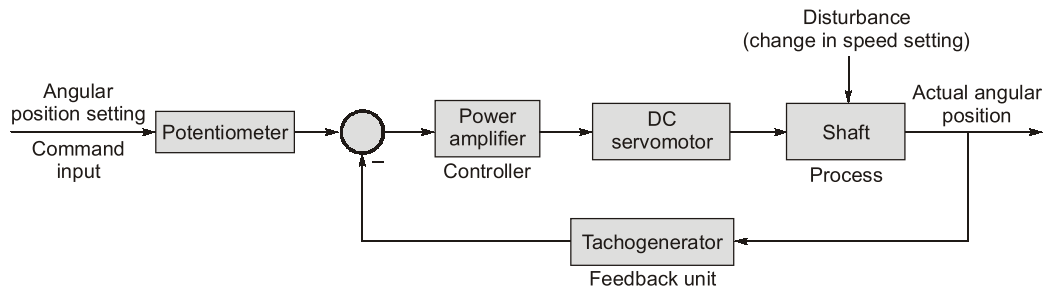

**Example - 1.4**

Discuss the position control scheme of a dc servomotor. Draw the block diagram and label the components.

**Solution:**

The position control scheme using a dc servomotor can be achieved by varying the armature voltage at constant field current. The angular position is preset on the potentiometer. The dc voltage given by tachogenerator is preoperational to angular rotation of shaft. This is compared with potentiometer output voltage to obtain error signal. The error is amplified and applied to dc motor and its angular position is varied.

**Remember**

- Feedback is not used for improving stability
- An open loop stable system may also become unstable when negative feedback is applied
- Except oscillators, in positive feedback, we have always unstable systems.

## 1.4 Comparison between Open-Loop and Closed-Loop Control Systems

Open-loop system	Closed-loop system
1. Internal or external disturbances cause drifts in desired output.	1. Use of feedback makes the system response relative insensitive to external and internal disturbances.
2. Accurate control is not possible unless regular recabrations are done.	2. Accurate control can be obtained using relatively inaccurate and inexpensive components.
3. Easier to build because system stability is not a major concert.	3. Stability is a major problem which may tend to overcorrect errors and cause oscillations.
4. Used for systems in which inputs are known ahead of time and there are no disturbances.	4. Advantageous only when unpredictable disturbance/parameter variations are present.
5. To decrease required cost and power of system, open-loop systems are used.	5. Due to more components used, closed-loop systems have higher and power.

## 1.5 Laplace Transformation

In order to transform a given function of time  $f(t)$  into its corresponding Laplace transform first multiply  $f(t)$  by  $e^{-st}$ ,  $s$  being a complex number ( $s = \sigma + j\omega$ ). Integrate this product with respect to time with limits from zero to  $\infty$ . This integration results in Laplace transform of  $f(t)$ , which is denoted by  $F(s)$  or  $\mathcal{L}[f(t)]$ .

The mathematical expression for Laplace transform is,

$$\mathcal{L}[f(t)] = F(s), t \geq 0$$

where,

$$F(s) = \int_0^{\infty} f(t) \cdot e^{-st} dt$$

The original time function  $f(t)$  is obtained back from the Laplace transform by a process called inverse Laplace transformation and denoted as  $\mathcal{L}^{-1}$ .

Thus,  $\mathcal{L}^{-1} [\mathcal{L}\{f(t)\}] = \mathcal{L}^{-1} [F(s)] = f(t)$

The inverse Laplace transform can be calculated as follows:

$$\mathcal{L}^{-1}(F(s)) = f(t) = \frac{1}{2\pi j} \int_{\sigma-j\infty}^{\sigma+j\infty} F(s) e^{st} ds \quad \text{for } t > 0$$

**Existence of Laplace transform:** The Laplace transform of a function  $f(t)$  exists is the Laplace integral converges.

The time function  $f(t)$  and its Laplace transform  $F(s)$  form a transform pair.

S.No.	$f(t)$	$F(s) = \mathcal{L}[f(t)]$
1.	$\delta(t)$ unit impulse at $t = 0$	1
2.	$u(t)$ unit step at $t = 0$	$\frac{1}{s}$
3.	$u(t-T)$ unit step at $t = T$	$\frac{1}{s} e^{-sT}$
4.	$t$	$\frac{1}{s^2}$
5.	$\frac{t^2}{2}$	$\frac{1}{s^3}$
6.	$t^n$	$\frac{n!}{s^{n+1}}$
7.	$e^{at}$	$\frac{1}{s-a}$
8.	$e^{-at}$	$\frac{1}{s+a}$
9.	$t e^{at}$	$\frac{1}{(s-a)^2}$
10.	$t e^{-at}$	$\frac{1}{(s+a)^2}$
11.	$t^n e^{-at}$	$\frac{n!}{(s+a)^{n+1}}$
12.	$\sin \omega t$	$\frac{\omega}{s^2 + \omega^2}$
13.	$\cos \omega t$	$\frac{s}{s^2 + \omega^2}$
14.	$\sinh \omega t$	$\frac{\omega}{s^2 - \omega^2}$
15.	$\cosh \omega t$	$\frac{s}{s^2 - \omega^2}$
16.	$\frac{1}{b-a} (e^{-at} - b e^{-bt})$	$\frac{1}{(s+a)(s+b)}$
17.	$\frac{1}{b-a} (b e^{-bt} - a e^{-at})$	$\frac{s}{(s+a)(s+b)}$
18.	$e^{-at} \sin \omega t$	$\frac{\omega}{(s+a)^2 + \omega^2}$
19.	$e^{-at} \cos \omega t$	$\frac{s+a}{(s+a)^2 + \omega^2}$

Table of Laplace Transform Pairs

## 1.6 Properties and Theorems of Laplace Transforms

1.  $L[Af(t)] = AF(s)$
2.  $L[f_1(t) \pm f_2(t)] = F_1(s) \pm F_2(s)$
3.  $L\left[\frac{d}{dt} f(t)\right] = sF(s) - f(0^+)$
4.  $L\left[\frac{d^2}{dt^2} f(t)\right] = s^2F(s) - sf(0^-) - \frac{df}{dt}(0^-)$
5.  $L\left[\frac{d^n}{dt^n} f(t)\right] = s^nF(s) - \sum_{k=1}^n s^{n-k} f^{(k-1)}(0^\pm)$   
 where,  $f^{(k-1)}(t) = \frac{d^{k-1}}{dt^{k-1}} f(t)$
6.  $L\left[\int f(t) dt\right] = \frac{F(s)}{s} + \frac{1}{s} \left[\int f(t) dt\right]_{t=0^-}$
7.  $L\left[\int \dots \int f(t) (dt)^n\right] = \frac{F(s)}{s^n} + \sum_{k=1}^n \frac{1}{s^{n-k+1}} \left[\int \dots \int f(t) (dt)^n\right]_{t=0^-}$
8.  $L\left[\int_0^t f(t) dt\right] = \frac{F(s)}{s}$
9.  $\int_0^\infty f(t) dt = \lim_{s \rightarrow 0} F(s)$  if  $\int_0^\infty f(t) dt$  exists
10.  $L[e^{-at} f(t)] = F(s + a)$
11.  $L[f(t - a)] u(t - a) = e^{-as} F(s) \quad a \geq 0$  [Time shifting]
12.  $L[tf(t)] = -\frac{dF(s)}{ds}$
13.  $L[t^2 f(t)] = \frac{d^2}{ds^2} F(s)$
14.  $L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} F(s) \quad n = 1, 2, 3, \dots$
15.  $L\left[\frac{f(t)}{t}\right] = \int_s^\infty F(s) ds$  if  $\lim_{t \rightarrow 0} \frac{f(t)}{t}$  exists
16.  $L\left[f\left(\frac{t}{a}\right)\right] = aF(as)$
17.  $L\left[\int_0^t f_1(t - \tau) f_2(\tau) d\tau\right] = F_1(s) F_2(s)$
18.  $L[f(t)g(t)] = \frac{1}{2\pi j} \int_{\sigma - j\infty}^{\sigma + j\infty} F(p) G(s - p) dp$

19.  $\mathcal{L}[af_1(t) + bf_2(t)] = aF_1(s) + bF_2(s)$
20. Initial value theorem:  $\lim_{t \rightarrow 0} f(t) = \lim_{s \rightarrow \infty} sF(s)$
21. Initial value theorem:  $\lim_{t \rightarrow 0} f(t) = \lim_{s \rightarrow \infty} sF(s)$

This theorem applies if and only if  $\lim_{t \rightarrow 0} f(t)$  exists which is true if all poles of  $sF(s)$  are in the left half of the s-plane.

**Example-1.5**

Find the inverse Laplace transform of the following functions:

- (i)  $F(s) = \frac{s+2}{s^2+4s+6}$
- (ii)  $F(s) = \frac{5}{s(s^2+4s+5)}$
- (iii)  $F(s) = \frac{s^2+2s+3}{s^3+6s^2+12s+8}$
- (iv)  $F(s) = \frac{1}{(s+1)^2(s+2)}$

**Solution:**

(i)  $F(s) = \frac{s+2}{s^2+4s+6}$

$\therefore$  The term  $(s^2+4s+6)$  can be expressed as  $[(s+2)^2+(\sqrt{2})^2]$

$\therefore F(s) = \frac{s+2}{(s+2)^2+(\sqrt{2})^2}$

Taking inverse Laplace transform on both sides

$$\mathcal{L}^{-1} F(s) = \mathcal{L}^{-1} \frac{s+2}{(s+2)^2+(\sqrt{2})^2}$$

$\therefore f(t) = e^{-2t} \cos \sqrt{2}t u(t)$

(ii)  $F(s) = \frac{5}{s(s^2+4s+5)}$

Using partial fraction expansion,

$$\frac{5}{s(s^2+4s+5)} = \frac{A}{s} + \frac{Bs+C}{s^2+4s+5}$$

The coefficients are determined as  $A = 1$ ,  $B = -1$  and  $C = -4$

$\therefore F(s) = \frac{1}{s} - \frac{s+4}{s^2+4s+5}$

$\therefore$  The term  $(s^2+4s+5)$  can be expressed as  $[(s+2)^2+(1)^2]$

$\therefore F(s) = \frac{1}{s} - \frac{s+2}{[(s+2)^2+(1)^2]} - 2 \frac{1}{[(s+2)^2+(1)^2]}$

Taking inverse Laplace transform on both sides

$$\mathcal{L}^{-1} F(s) = \mathcal{L}^{-1} \left[ \frac{1}{s} - \frac{s+2}{(s+2)^2+(1)^2} - 2 \frac{1}{(s+2)^2+(1)^2} \right]$$

or  $\mathcal{L}^{-1} F(s) = \mathcal{L}^{-1} \frac{1}{s} - \mathcal{L}^{-1} \frac{s+2}{[(s+2)^2+(1)^2]} - \mathcal{L}^{-1} 2 \frac{1}{[(s+2)^2+(1)^2]}$

$\therefore f(t) = (1 - e^{-2t} \cos t - 2e^{-2t} \sin t) u(t)$

$$(iii) \quad F(s) = \frac{s^2 + 2s + 3}{s^3 + 6s^2 + 12s + 8}$$

∴ The denominator ( $s^3 + 6s^2 + 12s + 8$ ) can be expressed as  $(s + 2)^3$

$$\therefore F(s) = \frac{s^2 + 2s + 3}{(s + 2)^3}$$

Using partial fraction expansion

$$F(s) = \frac{A}{(s + 2)} + \frac{B}{(s + 2)^2} + \frac{C}{(s + 2)^3}$$

The coefficients are determined as  $A = 1$ ,  $B = -2$  and  $C = 3$

$$\therefore F(s) = \frac{1}{s + 2} - \frac{2}{(s + 2)^2} + \frac{3}{(s + 2)^3}$$

Taking inverse Laplace transform on both sides

$$\mathcal{L}^{-1} F(s) = \mathcal{L}^{-1} \left[ \frac{1}{s + 2} - \frac{2}{(s + 2)^2} + \frac{3}{(s + 2)^3} \right]$$

$$\text{or} \quad \mathcal{L}^{-1} F(s) = \mathcal{L}^{-1} \frac{1}{s + 2} - \mathcal{L}^{-1} \frac{2}{(s + 2)^2} + \mathcal{L}^{-1} \frac{3}{(s + 2)^3}$$

$$\therefore f(t) = \left[ e^{-2t} - 2t e^{-2t} + \frac{3}{2} t^2 e^{-2t} \right] \cdot u(t)$$

$$\text{or} \quad f(t) = e^{-2t} \left[ 1 - t \left( 2 - \frac{3}{2} t \right) \right] \cdot u(t)$$

(iv) The partial fraction expansion of  $F(s)$  is

$$F(s) = A + \frac{B}{s + 1} + \frac{C}{(s + 1)^2} + \frac{D}{s + 2}$$

The coefficients  $A$ ,  $B$ ,  $C$ ,  $D$  are given by

$$A = 0$$

$$B = \frac{d}{ds} (s + 1)^2 F(s) \Big|_{s=-1} = \frac{d}{ds} \left( \frac{1}{s + 2} \right) \Big|_{s=-1} = -1$$

$$C = (s + 1)^2 F(s) \Big|_{s=-1} = \frac{1}{s + 2} \Big|_{s=-1} = 1$$

$$D = (s + 2) F(s) \Big|_{s=-2} = 1$$

Thus,

$$F(s) = -\frac{1}{s + 1} + \frac{1}{(s + 1)^2} + \frac{1}{s + 2}$$

⇒

$$f(t) = -e^{-t} u(t) + e^{-t} r(t) + e^{-2t} u(t)$$

#### Example - 1.6

Given,  $F(s) = \frac{10}{s(s + 1)}$ , what is  $\lim_{t \rightarrow \infty} f(t)$ ?

**Solution:**

$$F(s) = \frac{A}{s} + \frac{B}{(s + 1)}$$

$$F(s) = \frac{10}{s} - \frac{10}{s+1}$$

Taking inverse Laplace,

$$f(t) = 10 - 10e^{-t}$$

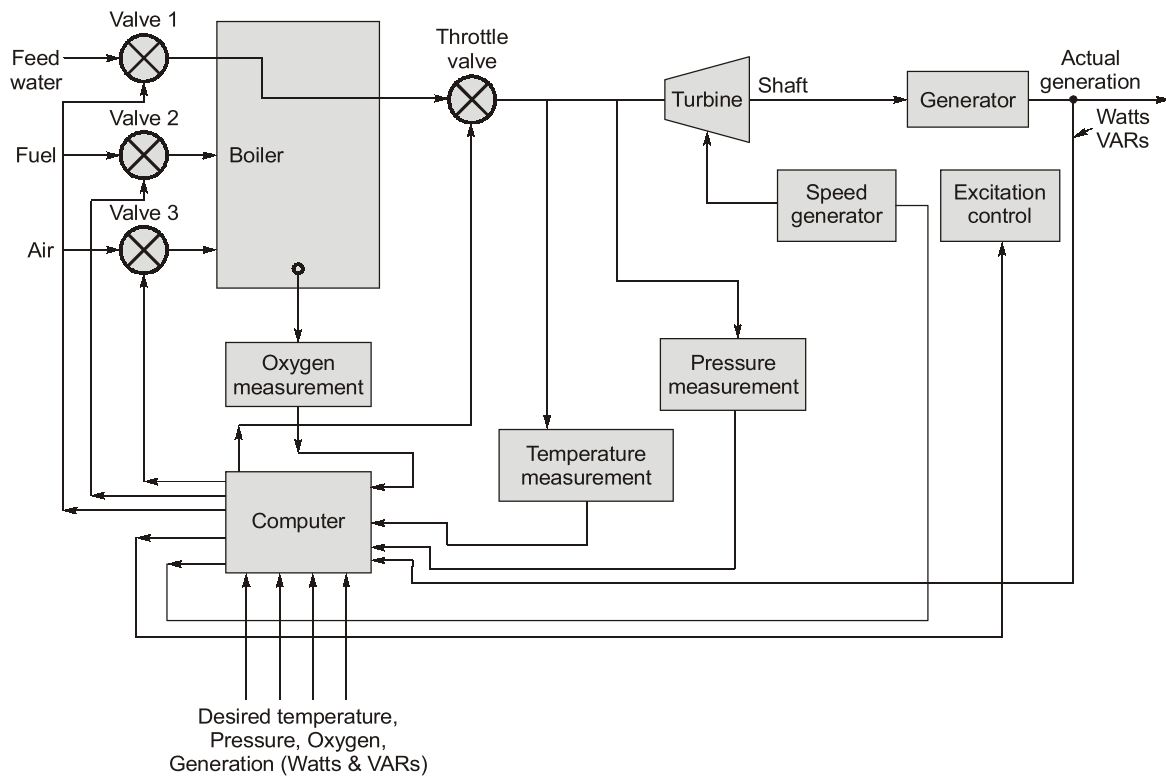

$$= 10(1 - e^{-t})$$

$$\lim_{t \rightarrow \infty} f(t) = 10$$

**Example - 1.7**

Draw the boiler generator control of a typical thermal power station.

**Solution:**

**Example - 1.8**

Apply Laplace transform to solve ordinary differential equations, solve the following differential equation.

$$\frac{d^2 x(t)}{dt^2} + \frac{3 dx(t)}{dt} + 2x(t) = 15u(t); \quad x(0^+) = -1, x'(0^+) = 2$$

**Solution:**

Applying Laplace transform on both sides,

$$s^2 X(s) - sx(0^+) - x'(0) + 3sX(s) - 3x(0^+) + 2X(s) = \frac{15}{s}$$

$$\Rightarrow s^2 X(s) + s - 2 + 3sX(s) + 3 + 2X(s) = \frac{15}{s}$$

$$\Rightarrow X(s) = \frac{15 - s(s+1)}{s(s^2 + 3s + 2)} = \frac{-s^2 - s + 15}{s(s+1)(s+2)}$$

Resolving into partial fractions we get,

$$X(s) = \frac{15}{2s} - \frac{15}{s+1} + \frac{13}{2(s+2)}$$

Taking inverse Laplace transform, we get

$$x(t) = \left[ \frac{15}{2} - 15e^{-t} + \frac{13}{2}e^{-2t} \right] u(t)$$

**Example - 1.9**

A unit-doublet function is obtained by differentiating the unit-impulse function, expressed as,

$$u_2(t) = \lim_{t_0 \rightarrow 0} \frac{u(t) - 2[u(t - t_0)] + u(t - 2t_0)}{t_0^2}$$

Obtain Laplace transform of  $u_2(t)$ .

**Solution:**

$$\begin{aligned} L[u_2(t)] &= \lim_{t_0 \rightarrow 0} \frac{1}{t_0^2} \left[ \frac{1}{s} - \frac{2}{s} e^{-t_0 s} + \frac{1}{s} e^{-2t_0 s} \right] \\ &= \lim_{t_0 \rightarrow 0} \frac{1}{t_0^2 s} \left[ 1 - 2 \left( 1 - t_0 s + \frac{t_0^2 s^2}{2} + \dots \right) + \left( 1 - 2t_0 s + \frac{4t_0^2 s^2}{2} + \dots \right) \right] \\ &= \lim_{t_0 \rightarrow 0} \frac{1}{t_0^2 s} [t_0^2 s^2 + \text{Higher order terms in } t_0 s] = s \end{aligned}$$

**Example - 1.10**

Find the initial value of  $\frac{df(t)}{dt}$  where  $f(t)$  Laplace transform given by

$$F(s) = \frac{3s + 2}{s^2 + s + 1}$$

**Solution:**

Using initial value theorem,

$$f(0^+) = \lim_{t \rightarrow 0^+} f(t) = \lim_{s \rightarrow \infty} sF(s) = \lim_{s \rightarrow \infty} \frac{s(3s+2)}{s^2+s+1} = 3$$

$$\begin{aligned} \therefore L\left[\frac{df(t)}{dt}\right] &= sF(s) - f(0^+) \\ &= \frac{s(3s+2)}{s^2+s+1} - 3 = \frac{-s-3}{s^2+s+1} \end{aligned}$$

The initial value of  $\frac{d}{dt}(f(t))$  is given by

$$\lim_{t \rightarrow 0^+} \frac{df(t)}{dt} = \lim_{s \rightarrow \infty} s[sF(s) - f(0^+)] = \lim_{s \rightarrow \infty} \frac{-s^2 - 3s}{s^2 + s + 1} = -1$$

**Example - 1.11**

Find the Laplace transform of the following periodic function:

**Solution:**

$$\begin{aligned} \int_0^T f(t) e^{-st} dt &= \int_0^{T/2} e^{-st} dt + \int_{T/2}^T (-1) e^{-st} dt \\ &= \frac{e^{-st}}{-s} \Big|_0^{T/2} + (-1) \frac{e^{-st}}{-s} \Big|_{T/2}^T = \frac{e^{-sT/2} - 1}{-s} + \frac{e^{-sT} - e^{-sT/2}}{s} \\ &= \frac{1}{s} [e^{-sT} - 2e^{-sT/2} + 1] = \frac{1}{s} [1 - e^{-sT/2}]^2 \end{aligned}$$

For periodic function,

$$\begin{aligned} F(s) &= \frac{\int_0^T f(t) e^{-st} dt}{1 - e^{-sT}} = \frac{\frac{1}{s} (1 - e^{-sT/2})^2}{1 - e^{-sT}} \\ &= \frac{1}{s} \frac{1 - e^{-sT/2}}{1 + e^{-sT/2}} = \frac{1}{s} \tanh \frac{sT}{4} \end{aligned}$$

Derivation of Laplace transform for periodic functions:

$$L[f(t)] = \int_0^\infty f(t) e^{-st} dt = \sum_{n=0}^\infty \int_{nT}^{(n+1)T} f(t) e^{-st} dt$$

By changing independent variable from  $t$  to  $\tau$ , where  $\tau = t - nT$ ,

$$L[f(t)] = \sum_{n=0}^\infty e^{-nTs} \int_0^T f(\tau) e^{-s\tau} d\tau \quad \dots(i)$$

Using,

$$f(\tau + nT) = f(\tau) \text{ since } f(t) \text{ is periodic with period } T$$

$$\begin{aligned} \sum_{n=0}^\infty e^{-nTs} &= 1 + e^{-Ts} + e^{-2Ts} + \dots \\ &= 1 + e^{-Ts} (1 + e^{-Ts} + e^{-2Ts} + \dots) \\ &= 1 + e^{-Ts} \sum_{n=1}^\infty e^{-(n-1)Ts} \\ &= 1 + e^{-Ts} \cdot \frac{1}{1 - e^{-Ts}} = \frac{1}{1 - e^{-Ts}} \end{aligned}$$

$\therefore$

$$L[f(t)] = \frac{\int_0^T f(\tau) e^{-s\tau} d\tau}{1 - e^{-Ts}} \quad [\text{From equation (i)}]$$
